

Title -Phishing Email Detector

■ **Project Name-** Phishing Email Detector

■ **Objective-** The objective of this project is to help users identify phishing emails by checking for suspicious keywords and providing a basic risk level with security recommendations. It aims to spread cybersecurity awareness and reduce the chances of online fraud.

■ **Problem Statement-** Phishing emails are one of the most common cyberattacks. Many users unknowingly click on fake links or share sensitive information such as passwords, OTPs, or bank details. This project provides a simple method to detect suspicious emails using keyword analysis and educate users about safe online practices.

■ **Research Findings-**

Most phishing emails contain urgent or attractive words to trick users.

Common phishing keywords include:

- Urgent
- Click Here
- Verify
- Password
- OTP
- Bank
- Lottery
- Congratulations
- Prize
- Won

Phishing attacks often create fear or excitement to make users act without thinking. Keyword-based detection is a simple and effective way to identify basic phishing attempts.

■ **Methodology-**

Counts the number of detected keywords.

Based on the count, it classifies the email as:

- High Risk
- Medium Risk
- Low Risk

It displays the suspicious keywords found and provides safety advice.

■ **Tools Used-**

Mobile Phone
Project Documentation
Internet Connection
Sample Phishing Email Examples
Basic Keyword Analysis

■ **Example Email-**

Congratulations! You have won ■50,000. Click here immediately to claim your prize. Verify your bank account now.

■ **Detection Process-**

The system checks for words like:

Congratulations
Won

Click Here
Prize
Verify
Bank

■Output-

Risk Level: High Risk

Suspicious Keywords Found:
Congratulations
Won
Click Here
Prize
Verify
Bank

■Security Advice-

- Do not click unknown links.
- Verify the sender's email address.
- Never share passwords or OTPs.
- Report suspicious emails.

■Objective and Problem Statement-

- Successfully identifies suspicious emails using predefined keywords.
- Categorizes emails into Low, Medium, or High Risk.
- Displays detected suspicious keywords.
- Provides users with cybersecurity safety tips.
- Increases awareness about phishing attacks.

■Challenges-

- Cannot detect advanced phishing emails without suspicious keywords.
- Does not verify email sender authenticity.
- Cannot analyze malicious attachments or hidden links.
- Limited to keyword-based detection.

■Future Scope-

- Verify sender email domain.
- Detect suspicious URLs (HTTP vs HTTPS).
- Scan QR codes contained in emails.
- Detect malicious attachments.
- Add voice input and multilingual support.

Conclusion- The Phishing Email Detector is a simple cybersecurity project that helps users recognize common phishing emails using keyword analysis. It classifies emails into different risk levels, highlights suspicious words, and provides security recommendations. Although it is a basic demonstration, it effectively promotes cybersecurity awareness and encourages safe online behavior.
